

## **THE NETCLEAN VMWARE TECH INTEGRATION**

### **- DEPLOY, MANAGE, INVESTIGATE**

NetClean's technical solutions are integrated with the VMware's Workspace ONE platform and VMware Carbon black. The interoperability makes it easier than ever for businesses to deploy and manage NetClean's solutions to protect their IT environment from child sexual abuse material, manage risk and protect their brand.

The combined data from NetClean's and VMware's technologies also makes it possible to conduct more thorough investigations when child sexual abuse material is discovered on company IT equipment.

NetClean and VMware share core values about using technology as a force for good. NetClean has joined the VMware Technology Alliance Partner (TAP) program in the solution areas Digital Workspace and Security/Carbon Black. More information is available at VMware Marketplace.

The integration of NetClean ProActive and NetClean ProTective facilitates both deployment and management of these products for customers who already use Workspace ONE to manage their IT environment on one platform. It also makes it easier for Workspace ONE users who don't have protection against child sexual abuse material in their IT environment, to effortlessly add this to their existing IT portfolio.

### **WORK COMPUTERS, SMARTPHONES AND TABLETS ARE USED TO ACCESS CHILD SEXUAL ABUSE MATERIAL**

**1/500** individuals look at child sexual abuse material while using a work device.

NetClean ProActive is a powerful scalable detection software that manages security risks by keeping IT environments free from child sexual abuse material. NetClean ProTective is an effective blocking solution used to protect business mobile devices (provided to employees) by preventing access to child sexual abuse material.

By implementing ProActive and/or ProTective businesses can stop illegal activity and the revictimisation of children. It also helps build a brighter future for children, it protects and strengthens company values, while working towards the requirements of Agenda 2030.

## THE VALUE OF THE NETCLEAN VMWARE TECH INTEGRATION IN BRIEF:

### DEPLOY

By using VMware Workspace ONE, it is easy to deploy, install and manage NetClean's detection and blocking solutions on any device in a secure and controlled way.

NetClean ProActive, the detection solution, protects endpoints and works similar to anti-virus software, by finding images and videos that law enforcement have classified as child sexual abuse material.

The blocking solution NetClean ProProtective, blocks sites known to contain illegal images, and is aimed at business mobile devices where detection on file level is currently not possible. NetClean ProProtective is deployed through VMware Workspace ONE, with data provided by trusted sources consisting of world leading organisations working to combat child sexual abuse.

Both ProProtective and ProActive protect businesses, enhance resilience and reduce real world harm to children.

### MANAGE

VMware Workspace ONE enables global reach and continuous maintenance of endpoints and devices through one platform, even to a remote and dispersed workforce. It also provides control and visibility across the entire stack of devices, and easy handling of updates and lifecycle asset management.

Through the integration of NetClean solutions to VMware Workspace ONE, the customer has easy access to endpoints and devices, and can be sure to have the latest blocking lists and signature updates to detect and block child sexual abuse material.

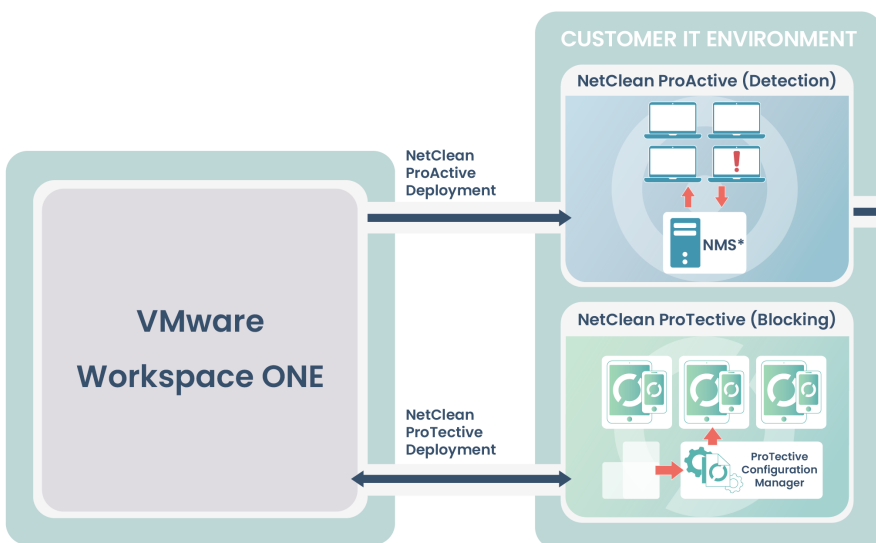

### INVESTIGATE

Through the interoperability to VMware Carbon Black, it is possible to conduct more advanced and thorough investigations of incidents reported by NetClean ProActive.

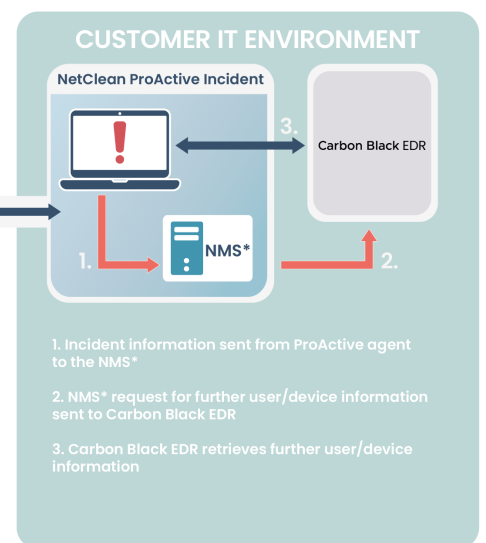

The powerful capabilities of Carbon Black can provide additional and vital case info, such as extended data and analysis of the user and endpoint that triggered the incident, thus aiding both the internal investigation and collaboration with law enforcement.
